From: Web3 Clubs Kenya
Re: Letter of Recognition - Butler, a Humanoid Hotel Robot by a Web3 Clubs Member

Dear Arjun and the Tameion Agents Hackathon Team,

We write on behalf of Web3 Clubs Kenya to formally recognise **Butler** as a project by one of our own members, **Bleyle Osewe**.This letter is submitted in fulfilment of the hackathon's traction requirement.

We are a developer-focused community of Web3 developer clubs building capacity for Web3 product development in Eastern Africa. We operate a Web3 exploration Lab in Nairobi and set up autonomous clubs in universities and tech hubs. Through these clubs we deliver Web3 awareness, technical skills training, hands-on mentorship, and resources to students, self-taught developers, and professionals, helping them move into Web3 and ship real products.

Bleyle has been a consistent presence at some of our lab sessions and talks. Having reviewed his project, we are pleased to endorse it and would be glad to continue supporting it beyond the scope of the hackathon

Our Understanding of the Project

As we understand it, Butler is a service robot designed for hotels. A guest orders food or a drink, the robot collects the order, and then delivers it to the guest's room. The guest's USDC is held in escrow and is only released once the order is confirmed on the table.

The blockchain components are what make this trustworthy, and they are the parts most relevant to us:

- **Peaq network:** Butler carries a public identity on peaq, so every job is tied to a named machine and the robot's work is recorded on-chain.
- **Circle and Arc testnet:** USDC escrow and payment settlement run here, so every payment move, from lock to release, sits on a public record.

Beyond hospitality

Once proven in a hotel, we see this model carrying over to healthcare and other fields. The core pattern is the same. A machine with a verifiable identity completes a task, the work is recorded publicly, and payment is released when delivery is confirmed.

Why We Support This

Kenya's hospitality sector is one of the country's largest workplaces. More than 900 accredited hotels, more than 45,000 rooms, roughly KSh 0.5 trillion in tourism earnings in 2025, and about 1.8 million travel and tourism jobs. A transparent, machine-verified delivery receipt with support for payments, is exactly the kind of infrastructure that should exist here.

Butler is a practical, early version of that. It is the right kind of Web3 project.

Our Commitment

Web3 Clubs Kenya is pleased to state the following:

1. Butler is a Web3 Clubs project. Bleyle Osewe is a member in good standing. The project was developed in part through engagement with the community.

2. The club intends to offer support beyond the hackathon. We see Butler as a project worth continuing into a pilot and, in time, a product.

3. The club's lab is available to Butler for pilot operations. Bleyle and the Butler project are welcome to use the Web3 Clubs lab space to test, demonstrate, and iterate, including in front of hotel managers, potential partners, and any audience the Tameion programme may connect them with. The club also has a dedicated robotics space, so this offer is timely and fits the project well. We are open to hosting a live demo session at the lab.

4. We believe Bleyle is the right person to carry this. We believe Bleyle is the right person to carry this. He and his two-person team took an AI drone project to a podium finish at the NIRU National AI Hackathon, where the work won an award. He then presented that same work at the 3rd Mashariki Cooperation Conference in Diani, before an audience that included the President of Kenya, the Cabinet Secretary for Interior, and the Director-General of the National Intelligence Service.

He has also built at hackathons organized by ETH Safari and won prizes there, including the MetaMask prize. His GitHub shows a steady record of shipping, and he is one of the most active builders in the web3 space. Butler is a harder problem than anything he has taken on so far, and he is further along than most.

We are glad to be copied on any correspondence and available for any follow-up the programme organisers may need.

Issued from an official Web3 Clubs Kenya email, with **arjun@thecanteenapp.com** copied.

Warm regards,

Ochieng Odhiambo
